

41. The total weight is $(100)(660) = 6.6 \times 10^4$ N, and the words “raises ... at constant speed” imply zero acceleration, so the lift-force is equal to the total weight. Thus $P = Fv = (6.6 \times 10^4)(150/60) = 1.65 \times 10^5$ W.
